

Wireframing Lab

1. Create a layout wireframe for the screenshot that your lab instructor hands you in lab. For convenience, the screenshots are also available in digital form on the class website.

In this lab assignment, you are creating a layout wireframe – not writing any XHTML and/or CSS.

Use whichever tool you are most comfortable with. This includes:

- Mockingbird
- Mockflow
- Cacao
- HotGloo
- Pencil for Firefox
- Pidoco
- Adobe Suite (Photoshop / Illustrator / Fireworks)
- Slide Builder (PowerPoint, Keynote)
- Sketch (pencil on paper – if your cell phone has a camera that can work as a scanner if one isn't available)

You don't have to use the 960 Grid System – but if your screenshot conforms to a 960px grid then feel free to use it!

Even if you don't use a special grid system like 960gs, think about the format of your layout. Does it conform to some type of common layout? (two-col, three-col, golden ratio, etc)

When you're finished your layout wireframe, upload it to
/home/students/nid/public_html/dig3716c/lab4_wireframe

When everyone is done, your lab instructor will pick some volunteers to display their interpretations and host a discussion.
